

Private AI deployment requirements brief

Define the system and proof before you compare models or suppliers.

WHY PRIVATE AI IS NEEDED

WHERE IT MAY RUN

- ☐ Managed service
- ☐ Private cloud
- ☐ Own servers
- ☐ Hybrid

SHIFT & LEAD EXAMPLE

For a worker in a private network, name what stays private, what still connects to a managed service, the exact model licence and who operates every part. Test with non-sensitive data first.

1 Data and storage

List data types, processing and storage locations, retention, encryption, training and deletion rules.

2 Access and identity

Name who can use or administer it, how they sign in and the network or role limits.

3 Company knowledge

Name the sources, connectors and logs. State what the AI may retrieve and what stays separate.

4 Model and licence

Record the exact release, rights, obligations, update plan and replacement option.

5 Owner and support

Name the owner and support for security, infrastructure, monitoring, incidents, upgrades and users.

6 Budget and proof

Write the total budget. Define success for quality, control, delivery time and maintenance.

7 / CHOOSE 1 BUYER DECISION

Approve the mandatory requirements, evidence, owners and simpler-hosted comparison before purchase.

- ☐ Shortlist this complete system.
- ☐ Get more evidence first.
- ☐ Use the simpler hosted option.
